Project Name	SmartLender – Applicant Credibility Prediction for Loan Approval
Maximum Marks	5 Marks

Section	Description
1. Customer Segment(s) [CS]	Loan applicants (salaried and self-employed individuals) seeking financial assistance, and bank loan officers responsible for reviewing loan applications.
2. Problems / Pains + Frequency [PR]	Applicants experience delays in loan approval and uncertainty about the outcome. Loan officers spend considerable time manually reviewing every application. These issues occur with every loan application.
3. Triggers to Act [TR]	Applicants need quick loan approval for personal, educational, business, or property purposes. Banks require faster and more consistent decision-making to reduce manual workload.
4. Emotions Before / After [EM]	Before: Applicants feel anxious, uncertain, and stressed while waiting for approval. After: Applicants feel reassured by a quick prediction, while loan officers gain confidence through consistent and data-driven decisions.
5. Available Solutions & Pros/Cons [AS]	Manual Loan Review: Accurate but time-consuming and inconsistent. Traditional Credit Assessment: Reliable but requires significant manual effort and longer processing time.
6. Customer Limitations [CL]	Applicants have limited knowledge of approval criteria and expect quick responses. Loan officers have limited time to review a large number of applications manually.
7. Behavior + Intensity [BE]	Applicants frequently check their application status and seek faster responses. Loan officers continuously review numerous applications under time pressure, especially during peak periods.
8. Channels of Behavior [CH]	Online: Smart Lender web application. Offline: Bank branch staff assisting applicants with data entry and loan processing.
9. Problem Root Cause [RC]	Loan approval depends on multiple factors such as income, credit history, employment status, loan amount, dependents, and property area, making manual evaluation slow and inconsistent.
10. Your Solution [SL]	Develop a Smart Lender web application using a Random Forest machine learning model integrated with Flask to

	predict loan approval instantly based on applicant information, improving speed, consistency, and decision support for banks.
